

SmartClover

Healthcare artificial intelligence products for controlled clinical workflows

Company position

SmartClover develops healthcare artificial intelligence software and implementation services for organizations that need to evaluate, pilot, and operate regulated digital-health workflows with clear responsibilities, security evidence, and clinical oversight.

Flagship product: CerviGuard

CerviGuard is the primary commercial product: a live cervical-screening workflow surface for structured case intake, artificial-intelligence-assisted review metadata, dashboarding, triage coordination and clinician-led follow-up. It is positioned as decision support, not autonomous diagnosis or treatment decisioning.

Research pilot: DataGems

DataGems supports the synthetic-data research track as a live research pilot for healthcare research, testing and integration scenarios where real data use should be minimized and documented.

Why buyers engage

Healthcare artificial intelligence adoption depends on more than model performance. Buyers need operational fit, data-handling clarity, security documentation, procurement materials, clinical ownership and a credible path from pilot to production decision.

Commercial path

SmartClover sells through scoped B2B conversations with clinical leads, IT/security teams, procurement teams, and legal reviewers. The expected engagement sequence is qualification, scope workshop, security and data review, controlled pilot, and production decision.

Pilot package

A controlled pilot should define clinical scope, users, workflow handover, reporting cadence, data-processing boundaries, security evidence, procurement assumptions, responsibilities and decision criteria.

Buyer roles and target segment

The primary target segment is a clinic, hospital, screening programme, or research institution evaluating cervical-screening workflows. The commercial conversation normally involves a clinical or programme lead, an IT/security lead, procurement or legal reviewer, and an executive sponsor for pilot approval and production-readiness decisions.

Trust and cybersecurity

SmartClover services include implementation planning, healthcare cybersecurity review, NIS2 readiness documentation support, CRA-oriented product-security review support, procurement support and pilot reporting. SmartClover also conducts applied cybersecurity research in cooperation with NIS2COMPASS and AI STM Learning in the CYberSynchrony context, focused on public-safe readiness documentation and evidence workflows.

Current proof

- CerviGuard has a public product page and live product workspace showing secure access, de-identified case intake, review metadata, dashboarding and follow-up workflow.
- SmartClover publishes pricing, buying, trust, regulatory, proof and contact routes for review before outreach.
- DataGems is represented as a live research pilot for synthetic-data workflow discussions within the SmartClover research track.
- Public NIS2COMPASS materials describe SmartClover's operational cybersecurity and dissemination role and exclude pilot-sensitive material.
- MDR Class I remains a positioning path subject to final legal and regulatory confirmation.

Investment milestone

The next financing milestone is conversion of product proof into dated commercial and operational evidence: qualified pilot agreements, approved workflow reporting, security documentation for procurement review, regulatory/QMS completion and a repeatable pilot-to-procurement process.

Use of funds

Priority use-of-funds categories are CerviGuard hardening, clinical and operational evidence, regulatory and QMS completion, security documentation and qualified pilots.
